

## Home Depot contracts Accuware for inventory management

**Accuware announces that its ProActive Inventory Management software will be used to manage store infrastructure items for Home Depot. Software will be deployed in April 2010.**

Accuware Inc. and Home Depot of Canada reached an agreement in January to deploy Accuware's ProActive Inventory Manager software.

Home Depot's 3 distribution centers and 185 stores needed a solution to more accurately control items such as racking, shelving, fixtures, and other store infrastructure items.

Accuware will also be providing the hosting environment to minimize IT resources needed to get the software up and running quickly.

Because ProActive Inventory Manager is a browser based solution the software can be easily shared by Home Depot staff all across Canada. Consolidation into a single system will help Home Depot manage their items more efficiently.

The system also features an array of Excel import functions to dramatically reduce the tedious task of loading new inventory, handling store returns, and updating item master cost changes.

SAP generated output files can easily be used to update the system with changes. Accuware's project management team worked with Home Depot over the last few months to ensure that Accuware's ProActive fit their

preexisting data structure and that repeat tasks were simplified in the new system.
